Question ①

Given

TCP checksum is an end-to-end checksum
so, its computed by source device &
verify by destination devices

therefore,

Number. of times TCP checksum is
calculated is one (1).

IP checksum is a node-to-node checksum
It is computed everytime it reaches a
new node

Hence, Number of times IP checksum is
calculated is (6) six

Question 2

In the cryptographic technique,

Monoalphabetic substitution technique is the substitution type Traditional cipher cryptographic technique.

in which.

the Plain text all the characters shifted to left or right (k) times.

So, for example.

Plain text : TATA and $k=3$

cipher text : WDWB

Now, if the $k=25$ then the plain text again become the prev. plain text

hence, we wouldn't achieve the crypto here

hence,

the range of keys (k) = 1 to 25

to apply this technique.

Encryption

$E(P) =$

$$(P+k) \% \text{mod } 26.$$

Decryption

$$D(C) = (C-k) \% \text{mod } 26$$

Question 3

plain text = "rajneeshpandeyrajneeshpand"

Given

key: [5 3 2 6 4 1]

Applying transposition technique:

PT \Rightarrow

1	2	3	4	5	6
r	a	j	n	e	e

 \xrightarrow{CT}

1	2	3	4	5	6
e	j	a	e	r	n

s h p a n d

$\xrightarrow{\text{encryption}}$

e y r a j n

e e s h p a

n

n d \$ \$ \$ \$ \$ \$

a s e p e n

\$ \$ \$ \$ \$ \$

column.

[6 \rightarrow 1, 1 \rightarrow 5, 2 \rightarrow 3, 3 \rightarrow 2, 4 \rightarrow 6, 5 \rightarrow 4]

rowwise encryption:

CT = "ejaern dphnsanryjeaasepen"

using key decryption.

r a j n e e
s h p a n d
e y r a j n
e n d \$ \$ \$ \$ \$ \$

Question 4

A1 :

(S1) sends mail to (D1)
(gmail)

A2 :

mail server of (D1) (both server same)

A3 : D1 has created a new folder.

S1, it downloads the mail.
to store from

IMAP.

IMAP protocol because

pop3 doesn't support
creating new folder.
server.

Question 5

(a) UDP (User Datagram Protocol)

Question:

Give the UDP header information.

→ Beyond IP, UDP provide additional services.

So

UDP also, • server Demultiplexing & error checking.

8 byte

fixed size

(b) TCP :

Question

Let's suppose, TCP server and client running on two different machine.

After completion of data transfer.

TCP client calls close to terminate the connection. & FIN segment is sent to the TCP server. Server-side TCP respond.

by sending an ACK which is received by client-side TCP. As per TCP diagram., which state does the client-side TCP connection wait for the FIN from server-side TCP?

Solution

There are two possibility

client receives
ACK for its FIN

client has sent FIN
segment but didn't
ACK till the time.

So, the ACK for its own FIN, After receiving ACK, client will move to TIME-WAIT state.

So, FIN-WAIT - 2.
